Package 'Brobdingnag'

January 20, 2025

Type Package

Title Very Large Numbers in R

Version 1.2-9

Maintainer Robin K. S. Hankin <hankin.robin@gmail.com>

Depends R (>= 2.13.0), methods, Matrix (>= 1.5-0)

Description Very large numbers in R. Real numbers are held using their natural logarithms, plus a logical flag indicating sign. Functionality for complex numbers is also provided. The package includes a vignette that gives a step-by-step introduction to using S4 methods.

Suggests cubature, testthat

License GPL

Index of help topics:

Arith-methods	Methods for Function Arith in package Brobdingnag
Brobdingnag-package	Very Large Numbers in R
Compare-methods	Methods for Function Compare in Package Brobdingnag
Re	Real and imaginary manipulation
[.brob	Extract or Replace Parts of brobs or glubs
abs	Various logarithmic and circular functions for brobs
as.numeric	Coerces to numeric or complex form
brob	Brobdingnagian numbers
brob-class	Class "brob"
brobmat	Brobdingnagian matrices
brobmat-class	Class '"brobmat"'
brobmat.mult	Brobdingagian matrix arithmetic
cbrob	Combine Brobdingnagian vectors
getP	Get and set methods for brob objects
glub	Glubbdubdribian numbers: complex numbers with
	Brobdingnagian real and imaginary parts
glub-class	Class "glub"
index-class	Class '"index"'
infinite	Infinite brobs and glubs
length	Get lengths of brobs and glubs
logic.brob	Logical operations on brobs
plot	Basic plotting of Brobs
print.brob	Methods for printing brobs and glubs
sum	Various summary statistics for brobs and glubs
swift-class	Class "swift"

Real numbers are represented by two objects: a real, holding the logarithm of their absolute values; and a logical, indicating the sign. Multiplication and exponentiation are easy: the challenge is addition. This is achieved using the (trivial) identity $\log(e^x + e^y) = x + \log(1 + e^{y-x})$ where, WLOG, y < x.

Complex numbers are stored as a pair of brobs: objects of class glub.

The package is a simple example of S4 methods.

However, it *could* be viewed as a cautionary tale: the underlying R concepts are easy yet the S4 implementation is long and difficult. I would not recommend using S4 methods for a package as simple as this; S3 methods would have been perfectly adequate. I would suggest that S4 methods should only be used when S3 methods are *demonstrably* inadequate.

Examples

```
googol <- as.brob(10)^100
googol
googol + googol/2
1/(googol + 1e99)
(1:10)^googol
googolplex <- 10^googol
googolplex
googolplex * googol # practically the same as googolplex (!)</pre>
```

Arith-methods *Methods for Function Arith in package Brobdingnag*

Description

Methods for Arithmetic functions in package Brobdingnag: +, -, *, /, ^

Note

The unary arithmetic functions (viz "+" and "-") do no coercion.

The binary arithmetic functions coerce numeric <op> brob to brob; and numeric <op> glub, complex <op> brob, and brob <op> glub, to glub.

Author(s)

Robin K. S. Hankin

```
x <- as.brob(1:10)
y <- 1e10
x+y
as.numeric((x+y)-1e10)</pre>
```

as.numeric

x^(1/y)

as.numeric

Coerces to numeric or complex form

Description

Coerces an object of class brob to numeric, or an object of class glub to complex

Arguments

Х	Object of class brob or glub
	Further arguments (currently ignored)

Details

Function as.numeric() coerces a brob to numeric; if given a glub, the imaginary component is ignored (and a warning given).

Function as.complex() coerces to complex.

Note

If |x| is greater than .Machine\$double.xmax, then as.numeric(x) returns Inf or -Inf but no warning is given.

Author(s)

Robin K. S. Hankin

```
a <- as.brob(1:10)
a <- cbrob(a, as.brob(10)^1e26)
a
as.numeric(a)
as.complex(10i + a)</pre>
```

Description

Create, coerce to or test for a Brobdingnagian object

Usage

```
brob(x = double(), positive)
as.brob(x)
is.brob(x)
```

Arguments

х	Quantity to be tested, coerced in to Brobdingnagian form
positive	In function brob(), logical indicating whether the number is positive (actually, positive or zero)

Details

Function as.brob() is the user's workhorse: use this to coerce numeric vectors to brobs.

Function is.brob() tests for its arguments being of class brob.

Function brob() takes argument x and returns a brob formally equal to e^x ; set argument positive to FALSE to return $-e^x$. Thus calling function $\exp(x)$ simply returns brob(x). This function is not really intended for the end user: it is confusing and includes no argument checking. In general numerical work, use function as.brob() instead, although be aware that if you really really want e^{10^7} , you should use brob(1e7); this would be an **exact** representation.

Note

Real numbers are represented by two objects: a real, holding the logarithm of their absolute values; and a logical, indicating the sign. Multiplication and exponentiation are easy: the challenge is addition. This is achieved using the (trivial) identity $\log(e^x + e^y) = x + \log(1 + e^{y-x})$ where, WLOG, y < x.

Complex numbers are stored as a pair of brobs: objects of class glub.

The package is a simple example of S4 methods. However, it *could* be viewed as a cautionary tale: the underlying R concepts are easy yet the S4 implementation is long and difficult. I would not recommend using S4 methods for a package as simple as this; S3 methods would have been perfectly adequate. I would suggest that S4 methods should only be used when S3 methods are *demonstrably* inadequate.

The package has poor handling of NA and NaN. Currently, as. brob(1) + as.brob(c(1, NA)) returns an error.

brob

brob-class

Author(s)

Robin K. S, Hankin

See Also

glub

Examples

```
googol <- as.brob(10)^100
googolplex <- 10^googol</pre>
```

```
(googolplex/googol) / googolplex
# Thus googolplex/googol == googolplex (!)
```

```
# use cbrob() instead of c() when Brobdingnagian numbers are involved:
cbrob(4,exp(as.brob(1e55)))
```

brob-class

Class "brob"

Description

The formal S4 class for Brobdingnagian numbers

Objects from the Class

Objects *can* be created by calls of the form new("brob", ...) but this is not encouraged. Use functions brob() and, especially, as.brob() instead.

Slots

x: Object of class "numeric" holding the log of the absolute value of the number to be represented positive: Object of class "logical" indicating whether the number is positive (see Note, below)

Extends

Class "swift", directly.

Note

Slot positive indicates non-negativity, as zero is conventionally considered to be "positive".

Author(s)

Robin K. S. Hankin

See Also

glub-class,swift-class

Examples

new("brob",x=5,positive=TRUE) # not intended for the user

as.brob(5) # Standard user-oriented idiom

brobmat

Brobdingnagian matrices

Description

Basic matrix arithmetic for Brobdingnagian numbers. Matrix addition, multiplication extraction and replacement implemented but not the determinant or matrix inverse.

Usage

```
brobmat(..., positive)
newbrobmat(x,positive)
as.brobmat(x)
is.brobmat_to_brob(x)
diag(x,...)
## S3 method for class 'brobmat'
print(x,...)
t(x,...)
```

Arguments

Х	Argument
	Further arguments
positive	Logical, indicating whether an element is positive

Details

Basic arithmetic for Brobdingnagian matrices.

Function brobmat() is like brob() in that it interprets its first argument as the exponent (but creates a matrix). Function as.brobmat() coerces a numeric matrix to a brobmat.

Value

Generally return a brobmat or brob.

8

brobmat-class

Author(s)

Robin K. S. Hankin

Examples

```
brobmat(-10:19,5,6)
as.brobmat(matrix(-10:19,5,6))
```

brobmat-class Class "brobmat"

Description

The brobmat class provides basic Brobdingnagian arithmetic for matrices.

Objects from the Class

Objects can be created by calls of the form new("brobmat", ...), although functions brobmat(), as.brobmat() are more user-friendly.

Slots

x: Object of class "matrix" that specifes the exponent

positive: Object of class "logical" that specifies the sign

Methods

```
[ signature(x = "brobmat", i = "ANY", j = "ANY"): ...
[ signature(x = "brobmat", i = "index", j = "missing"): ...
[ signature(x = "brobmat", i = "missing", j = "index"): ...

brobmat.mult

Description

Basic arithmetic for Brobdingnagian matrices

Usage

```
brobmat.mult(e1, e2)
brobmat.add(e1, e2)
brobmat.mult(e1, e2)
brobmat.power(e1, e2)
brobmat.inverse(e1)
brobmat.greater(e1, e2)
brobmat.equal(e1, e2)
getat(e1, e2)
```

Arguments

e1, e2 Arguments coerced to brobmat

Details

These functions are helper functions used by the brobmat Arith group and are not designed to be user-friendly. Function getat() is a helper function that sets attributes such as dimnames of returned values.

Value

Return a brobmat, or logical for the comparison operators.

Author(s)

Robin K. S. Hankin

Examples

```
a <- brobmat(1:54,6,9)
rownames(a) <- letters[1:6]
a + 1e30
a-a
b <- as.brobmat(matrix(rnorm(27),9,3))
colnames(b) <- month.abb[1:3]</pre>
```

a %*% b

cbrob

Description

Combine Brobdingnagian or Glubdubbdribian vectors through concatenation

Usage

cbrob(x, ...)

Arguments

х	Brobdingnagian vector
	Other arguments coerced to brob form

Details

If any argument has class glub, all arguments are coerced to glubs. Otherwise, if any argument has class brob, all arguments are coerced to brobs.

Function cbrob() operates recursively, calling .cPair() repeatedly. Function .cPair() uses S4 method dispatch to call either .Brob.cpair() or .Glub.cpair() according to the classes of the arguments.

Note

As of R-2.4.0, it is apparently not possible to use S4 methods to redefine c() to coerce to class brob form and concatenate as expected. This would seem to be a reasonable interpretation of c() from the user's perspective.

Conceptually, the operation is simple: concatenate the value slot and the positive slot separately, then call brob() on the two resulting vectors. When concatenating glub objects, the real and imaginary components (being brobs) are concatenated using .Brob.cpair()

The choice of name—cbrob()—is not entirely logical. Because it operates consistently on brob and glub objects, it might be argued that cSwift() would be a more appropriate name.

Author(s)

Robin K. S. Hankin; original idea due to John Chambers

```
a <- as.brob(2)^1e-40
cbrob(1:4,4:1,a)
cbrob(1:4,a,1i)</pre>
```

Compare-methods

Description

Methods for comparision (greater than, etc) in package Brobdingnag

Note

As for min() and max(), comparison is not entirely straightforward in the presence of NAs.

The low-level workhorses are .Brob.equal() for equality and .Brob.greater() for 'strictly greater than'. All other comparisons are calculated by combining these two.

Comparison [function .Brob.compare()] explicitly tests for a zero length argument and if given one returns logical(0) to match base behaviour.

Examples

a <- as.brob(10)^(0.5 + 97:103) a < 1e100

Complex

Real and imaginary manipulation

Description

Get or set real and imaginary components of brobs or glubs.

Usage

```
## S4 method for signature 'glub'
Re(z)
## S4 method for signature 'glub'
Im(z)
## S4 method for signature 'glub'
Mod(z)
## S4 method for signature 'glub'
Conj(z)
## S4 method for signature 'glub'
Arg(z)
Re(z) <- value
Im(z) <- value</pre>
```

Arguments

Z	object of class glub (or, in the case of Im<-() or Im(z) <- value, class brob)
value	object of class numeric or brob

Value

Functions Re() and Im() return an object of class brob; functions Re<-() and Im<-() return an object of class glub

Author(s)

Robin K. S. Hankin

Examples

```
a <- cbrob(1:10,brob(1e100))
Im(a) <- 11:1
a
```

	Extract.brob	Extract or Replace Parts of brobs or glub
--	--------------	---

Description

Methods for "[" and "[<-", i.e., extraction or subsetting of brobs and glubs.

Arguments

х	Object of class brob or glub
i	elements to extract or replace
value	replacement value

Value

Always returns an object of the same class as x.

Note

If x is a numeric vector and y a brob, one might expect typing $x[1] \le y$ to result in x being a brob. This is impossible, according to John Chambers.

Author(s)

Robin K. S. Hankin

getP

Examples

a <- as.brob(10)^c(-100,0,100,1000,1e32)
a[4]
a[4] <- 1e100
a</pre>

getP

Get and set methods for brob objects

Description

Get and set methods for brobs: sign and value

Usage

getP(x)
getX(x)
sign(x) <- value</pre>

Arguments

х	Brobdingnagian object
value	In function sign<-(), Boolean specifying whether the brob object is positive

Author(s)

Robin K. S. Hankin

See Also

brob

Examples

x <- as.brob(-10:10)
sign(x) <- TRUE</pre>

glub

Description

Create, coerce to or test for a Glubbdubdribian object

Usage

```
glub(real = double(), imag = double())
as.glub(x)
is.glub(x)
```

Arguments

real, imag	Real and imaginary components of complex number: must be Brobdingnagian numbers
x	object to be coerced to or tested for Glubbdubdribian form

Details

A Glubbdubdribian number is the Brobdingnagian equivalent of a complex number.

Function glub() takes two arguments that are coerced to Brobdingnagian numbers and returns a Glubbdubdribian number. This function is not really intended for the end user: it is confusing and includes no argument checking. Use function as.glub() instead.

Function as.glub() is the user's workhorse: use this to coerce numeric or complex vectors to Glubbdubdribian form.

Function is.glub() tests for its arguments being Glubbdubdribian.

Note

Function glub() uses recycling inherited from cbind().

glub-class

Examples

glub-class

Class "glub"

Description

Complex Brobdingnagian numbers

Objects from the Class

A glub object holds two slots, both brobs, representing the real and imaginary components of a complex vector.

Slots

real: Object of class "brob" representing the real component

imag: Object of class "brob" representing the imaginary component

Extends

Class "swift", directly.

Methods

```
.cPair signature(x = "brob", y = "glub"): ...
.cPair signature(x = "ANY", y = "glub"): ...
.cPair signature(x = "glub", y = "glub"): ...
.cPair signature(x = "glub", y = "ANY"): ...
.cPair signature(x = "glub", y = "brob"): ...
Im<- signature(x = "glub"): ...
Re<- signature(x = "glub"): ...</pre>
```

Author(s)

Robin K. S. Hankin

See Also

brob-class,swift-class

Examples

```
a <- as.brob(45)
new("glub",real=a, imag=a)
as.brob(5+5i)  # standard R idiom; imaginary component discarded
as.glub(5+5i)  # returns a Glubbdubdribian object</pre>
```

index-class Class	s "index"
-------------------	-----------

Description

A virtual class for matrix extraction, copied from the Matrix package.

Objects from the Class

A virtual Class: No objects may be created from it.

Methods

```
[ signature(x = "brobmat", i = "index", j = "index"): ...
[ signature(x = "brobmat", i = "index", j = "missing"): ...
[ signature(x = "brobmat", i = "missing", j = "index"): ...
[<- signature(x = "brobmat", i = "index", j = "index"): ...
[<- signature(x = "brobmat", i = "index", j = "missing"): ...
[<- signature(x = "brobmat", i = "missing", j = "index"): ...</pre>
```

infinite-methods Infinite brobs and glubs

Description

Brobdingnagian and Glubbdubdribian infinity

Usage

```
## S4 method for signature 'brob'
is.infinite(x)
## S4 method for signature 'glub'
is.infinite(x)
## S4 method for signature 'brob'
is.finite(x)
## S4 method for signature 'glub'
is.finite(x)
```

Arguments

x vector of class brob or glub

Details

For a Brobdingnagian number, is.infinite() returns TRUE if the exponent is infinite. A Glubbdubdribian number is infinite if either the real or imaginary component is infinite. Function is.finite() is simply the logical negation of is.infinite().

Author(s)

Robin K. S. Hankin

```
is.infinite(brob(c(1,4,Inf)))
```

```
is.infinite(glub(3,Inf))
is.infinite(glub(Inf,3))
```

```
is.infinite(exp(1e300))
is.infinite(brob(1e300))
# (Brobdingnagian infinity is bigger than regular infinity ;-)
```

length-methods

Description

Get lengths of brob and glub vectors

Usage

S4 method for signature 'brob'
length(x)
S4 method for signature 'glub'
length(x)

Arguments

vector of class brob or glub

Author(s)

х

Robin K. S. Hankin

Examples

x <- as.brob(-10:10)
length(x)</pre>

Logic

Logical operations on brobs

Description

Logical operations on brobs are not supported

Note

The S4 group generic "Logic" appeared in R-2.4.0-patched.

Carrying out logical operations in this group will call .Brob.logic(), which reports an error.

Negation, "!", is not part of this group: attempting to negate a brob will not activate .Brob.logic(); an "invalid argument type" error is given instead.

Author(s)

Robin K. S. Hankin

Math

Examples

Not run: !brob(10)

End(Not run)

Math

Various logarithmic and circular functions for brobs

Description

Various elementary functions for brobs

Arguments

Х	Object of class brob (or sometimes glub)
base	In function log(), the base of the logarithm

Details

For brobs: apart from abs(), log(), exp(), sinh() and cosh(), these functions return f(as.numeric(x)) so are numeric; the exceptional functions return brobs.

For glubs: mostly direct transliteration of the appropriate formula; one might note that log(z) is defined as glub(log(Mod(x)), Arg(x)).

Author(s)

Robin K. S. Hankin

Examples

exp(as.brob(3000)) #exp(3000) is represented with zero error

plot

Basic plotting of Brobs

Description

Plotting methods. Essentially, any brob is coerced to a numeric and any glub is coerced to a complex, and the argument or arguments are passed to plot().

Usage

plot(x, y, ...)

Arguments

х, у	Brob or glub
	Further arguments passed to plot()

Author(s)

Robin K. S. Hankin

Examples

plot(as.brob(1:10))

Print

Methods for printing brobs and glubs

Description

Methods for printing brobs and glubs nicely using exponential notation

Usage

S3 method for class 'brob'
print(x, ...)
S3 method for class 'glub'
print(x, ...)

Arguments

Х	An object of class brob or glub
	Further arguments (currently ignored)

Author(s)

Robin K. S. Hankin

```
a <- as.brob(1:5)
dput(a)
a
```

sum

Description

Various summary statistics for brobs and glubs

Arguments

х,	Objects of class brob or, in the case of sum() and prob(), class glub
na.rm	Boolean, with default FALSE meaning to interpret NAs literally and TRUE meaning
	to ignore any such elements

Details

For a brob object, being NA is not entirely straightforward. The S4 method for is.na is too "strict" for some of the functions considered here. Consider max(a) where a includes only positive, fully specified, elements, and elements with known negative sign and exponents that include NA values. Here, max(a) is unambiguously determined.

Similar logic applies to min() and, by extension, range().

Note

Function prod() is *very* slow for long glub vectors. It has to compute four Brobdingnagian products and two Brobdingnagian sums per element of its argument, and this takes a long time.

Author(s)

Robin K. S. Hankin

See Also

is.na

```
a <- as.brob(1:10)
max(cbrob(1:10,brob(NA,FALSE)))</pre>
```

swift-class

Description

A (virtual) class that extends brob and glub objects

Objects from the Class

A virtual Class: No objects may be created from it.

Methods

No methods defined with class "swift" in the signature.

Author(s)

Robin K. S. Hankin
